

## Maintaining the Silencer

1) Rimfire suppressors get very dirty quickly due to exposed lead ammo. Your checkmate silencer should be broken down for cleaning about every 500 rounds. 1) Start disassembly by removing the end cap. No tool is needed. Simply grasp the end cap with a rag or glove and unscrew moving in a counter clockwise direction. If using the thread mount interface again remove with a rag or glove. 2) To remove the QD mechanism place the lugs on the blue multi-tool into the rear of the mechanism. Unscrew using a 1" wrench or by grasping the multi-tool in a vice and interfacing the silencer on it, using the silencer as the rotating part. 3) Once the QD parts and spring are removed you can now screw the threaded section of the multi-tool into the silencer. Once installed screw the pusher rod into the multi tool and use a 3/4" wrench to drive the monocore baffle out of the suppressor tube. Your silencer is now fully disassembled. Clean with scrubbing tools and solvents and reassemble.

## Features of the CHECKMATE Silencer

### Multi tool

### Integral QD Mechanism

### High Performance Stainless Monocore

### Tool less front cap

The Checkmate Monocore Silencer combines a high performance, durable stainless baffle core, with an integral QD system for unsurpassed features and quality. The integral QD system adds minimal length and ensures a solid lock to the host firearm for worry free use. Additional 3 lug mounts can be purchased for affordable prices, or you can also swap the QD system to a traditional thread mount coupler available separately. Rimfire silencers have come a long way in recent years and the Checkmate Modular Monocore is unmatched in class. You don't have to compromise on features, quality, performance, or price. The checkmate has it all.

## Mounting the Silencer

Screw the 3 lug adapter onto the host firearm using the blue multi tool. If desired you can use blue (low yield) threadlocker to mount the 3 lug to the barrel. Put the silencer over the mount and pull firmly rearward, compressing the sprung bushing. While compressed, rotate 120 degrees clockwise and release allowing the silencer to snap into the 3 lug locked position. If the silencer can be rotated and pulled off without compressing the spring, the silencer is not mounted properly. Clean the mount interface of the silencer and the muzzle device after every use. Keeping the mount interface clean will ensure minimal Poi shift. This silencer is rated for full auto rimfire use in all rimfire calibers. This silencer should only be used on 18" and longer 22 magnum caliber firearms.

## Confirm Alignment

Clear your firearm in accordance with it's manufacturers user manual. After mounting the 3 lug adapter, attach the silencer to the mount. With the silencer locked in place or firmly tightened onto the host firearm look down the silencer bore from the end cap illuminating the bore with a light. Confirm visual alignment by ensuring the bore of the silencer is in the center of the bore of the firearms barrel. If you do not feel capable of confirming alignment take your firearm to your Griffin Dealer. Most silencer dealers that provide gunsmithing services have suppressor alignment check rods and other tools capable of fitting your silencer to your firearm. Keep in mind each firearm you use this silencer on needs to be checked for alignment.

WARNING: FAILURE TO READ AND UNDERSTAND THIS MANUAL PRIOR TO USE MAY RESULT IN INJURY OR DAMAGE

## Additional Mounts Available

Additional QD mounts and a Thread Mount Interface is available for the Checkmate Silencer.

THREAD MOUNT

3 LUG MOUNTS

Griffin Armament was started by two combat veterans with one goal...

To create quality, high performance products, that you can depend on. Knowing that high performance kit is a lifeline to coming back from mission, Griffin sought out to develop innovative and quality products worthy of use on deployment. Whether you are hunting, sport shooting, training, or professionally employing firearms; Griffin kit is up to the task.
